Github Repository Rule:

The National CCDC has approved the use of a team repository to store tools, scripts, patches, check lists, and other documents. Teams are instructed to create their own Github accounts but must notify and make their respective state director an owner of the account to facilitate adjudication and compliance. Note that teams are directed towards a Github account, and not Sourceforge or other similar platforms.

Teams must adhere to the following guidelines in building their repository:

- Tools must be either open source or free install files, no proprietary tools or free trials. No pirated software is allowed.
- All files must be freely accessible, no password zip files, encryption, &c.
- Scripts must be readable source or executable files with an instruction file that includes a description and how to use the tool.
- No ISO files for operating system installation or prebuilt VMs
- Documents must be pertinent to the CCDC, including how to documents, organization charts, strategy outlines, templates, notes, screen shots, &c.
- No prepared inject responses, based on past CCDC events, are allowed. Document templates for injects and incident responses are permitted.
- No custom docker containers
- The repository must not contain personal written content, images, or links to inappropriate media following professional behavior guidelines.

During repository development, only the specific team and CCDC state directors will have access. Teams must complete their repositories by EOD January 28, 2022, at which time their repository will be frozen for the MWCCDC Qualification events. Repositories will be adjudicated for appropriate content in accordance with the rules. Subsequently, all teams will be given public access to all team repositories, and full access will be given from the competition systems via the web proxy.

Subsequent to the MW Wildcard CCDC on March 5, 2022, all teams that will compete in the Erich J. Spengler MW Regional CCDC will be given from March 7 to March 12, 2022 to update their repositories. Subsequently repositories will be adjudicated once again.
